

FX DELTA

Trading Plan Cheat Sheet

Hello trader!

This short PDF is designed to help you make your trading decisions!

Before we get any further: this document and the content inside are related to the first FX Delta Education Webinar which you should watch (if you haven't) before you move one.

[WATCH EDUCATIONAL WEBINAR 1 HERE](#)

There are also references to divergences! Which means you must be aware of what divergence is (regular and hidden) before you move on. Not sure what divergence is?

[WATCH THE "RAPID DIVERGENCE COURSE" HERE](#)

Now we are ready to move on!

There are a few things we want to manually check before pulling the trigger on any given double arrow signal we received from the scanner.

As you know our main focus, when checking and confirming a trade falls on the higher time frame where the Delta Pattern is.

There are **3 scenarios** that we can find:

Scenario #1 –CONVERGENCE

Converging Moving Averages (of MACD indicator) and Converging Price - in other words, higher highs/lower lows on price and indicator. This is the best scenario!

HOW TO TRADE IT?

You don't have to wait for extra confirmation if a setup appears on the lower time frame. However the trade increases its probability to win if there will be any extra confirmations (hidden divergence, strong S/R levels, trend lines etc).

Scenario #2 – ANTI-CONVERGENCE

- Bullish Anti-Convergence – lower highs on price and indicator (MAs)

- Bearish Anti-Convergence- higher lows on price and indicator (MAs)

HOW TO TRADE IT?

Anti-convergence tells us 1 thing only – momentum is slowing down! Due to that fact is it advisable to use **any** type of extra confirmation. That could be:

- hidden divergence on the Higher TF (where the delta pattern is)
- trend lines
- channels
- Fibonacci zones
- pivot points
- etc...

Trading such setups without extra confirmation is more aggressive.

Scenario #3 – DELTA INSIDE DIVERGENCE

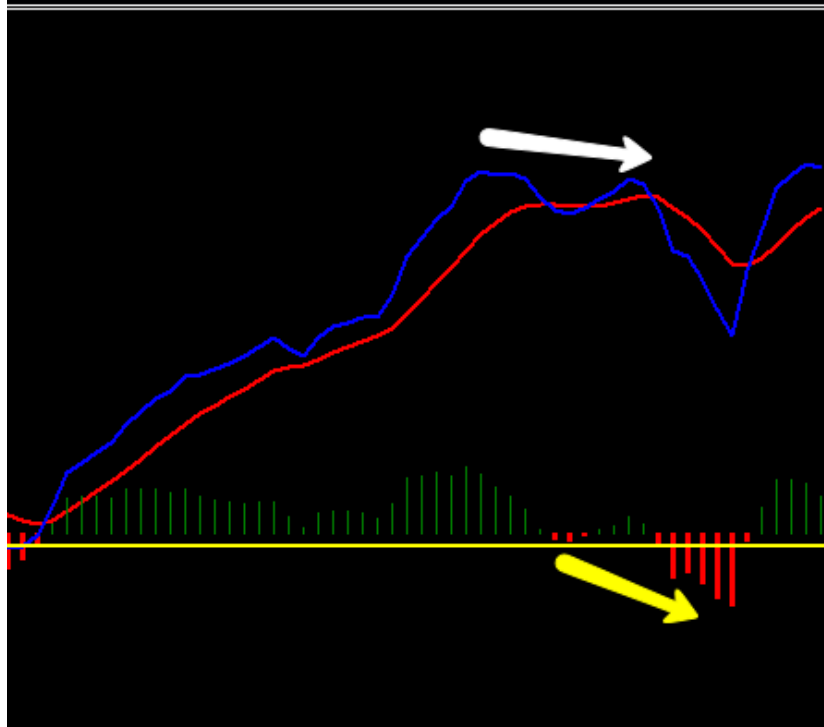

If the Delta Pattern (HTF), appears inside regular divergence (divergence which is against the direction of the delta pattern), you want to wait for this divergence to complete its job before attacking. How do we know the divergence has completed its job? Simple – we wait for **opposite** divergence to appear. Which means we want to see hidden divergence appearing **before** we start looking for entry setups.

- **Bullish Delta** Pattern inside **Bearish Regular Divergence**

HOW TO TRADE IT?

Wait for hidden bullish divergence to appear and only then look for entries IF the delta pattern is still valid (if invalidation was not reached).

Trading such setups without hidden divergence is very aggressive.

- **Bearish Delta** Pattern inside Regular **Bullish**

HOW TO TRADE IT?

Wait for hidden bearish divergence to appear and only then look for entries IF the delta pattern is still valid (if invalidation was not reached).

Trading such setups without hidden divergence is very aggressive.

Hope that this short PDF will make your life and trading decisions easier!

Warm Regards!

Yordan Kuzmanov
